Serialized GTIN - Usecase

USECASE

Problem Statement

Currently in our S/4HANA Public Cloud environment we don't have the capability to capture unique product identifier for materials or articles . Currently we are using an external application from our partner (Payfree) for one our store in Walldorf(S.MART) but for our store (S.MARKET) in Bangalore we would want to build an internal solution

Requirement

Enable capture, validation, and persistence of Serialized Global Trade Item Number (SGTIN) at the item level within retail business processes (goods receipt, stock handling, and POS integration).Serialization involves giving each individual material/article an unique identifier for enhanced supply chain security and traceability, using the Global Trade Item Number (GTIN) as the base product identifier, and adding a unique serial number to create a unique product identifier (UID). This combination, often called a Serialized GTIN (SGTIN), includes the GTIN, a serial number, and often other data like batch/lot number and expiration date, forming a complete record for each item in the supply chain.

Pre-requisites

- SAP S/4HANA Public Cloud (Retail Scope)

Personas

- Masterdata Specialist
- Inventory Manager
- Supply Chain Specialist

Business Process

- Masterdata Management
- Procurement
- Inventory Management
- Point of Sale

Focus Industries / LOB

- Consumer Industries
- All Line of Business

Outcome

Complete visibility and traceability of serialized retail items across procurement, warehouse, and sales processes. Alignment with GS1 and EPC global standards for serialization.

1 Demo Script Overview

1.1 Demo Description

In some business processes, it is necessary to uniquely identify items worldwide (such as individual components). Although a serial number is unique for a manufacturer, several items can have the same serial number (different materials, different manufacturers). The serial number is therefore not unique worldwide.

The unique item identifier (UII), however, is unique worldwide. This number consists of several pieces of information, such as the issuing agency code, the enterprise identifier, and the item's serial number.

Item unique identification (IUID) is available in many logistical processes:

- Purchasing
- Purchase requisition, purchase order, scheduling agreement, contracts
- Sales and distribution
- Sales order, scheduling agreement, contracts
- Goods movements
- Physical inventory
- Production
- Manufacturing order, confirmation for manufacturing orders
- Outbound and inbound delivery with packing information
- Plant maintenance
- Installation of technical objects, notification, maintenance order, refurbishment order

For demo purpose the Serial and UII will be required to be entered for Good Receipt at the store
